

The Anchor of Identity & Stability

1. Mission

MITO is the identity anchor of the DEMO ecosystem — the stabilizing force that grounds user identity, asset provenance, and ecosystem authority.

2. Purpose & Utility

MITO provides:

- Identity Verification: Acts as the root identity token for users, assets, and protocols.
- Stability Layer: Serves as the “anchor” token that other assets reference for trust.
- Access Control: Required for minting, upgrading, or linking identity-based assets.
- Reputation Weight: MITO holdings influence trust scores across the ecosystem.

3. Token Mechanics

- Supply: Fixed, deflationary.
- Minting: One-time genesis mint.
- Burn Logic: Burned when identity layers are merged or retired.

4. Governance

MITO holders can:

- Approve identity standards
- Vote on protocol-level trust rules
- Influence anchor-based scoring models

5. Technical Architecture

- SPL token
- Anchor-based identity registry
- On-chain signature verification
- Cross-protocol identity linking
